

This meta-analysis summarizes and explains the variation in the **detering effect** of distance on tourism flows by analyzing 870 estimates from 138 primary studies utilizing data covering the last 25 years. We find an **average** total distance-decay elasticity of -0.95.

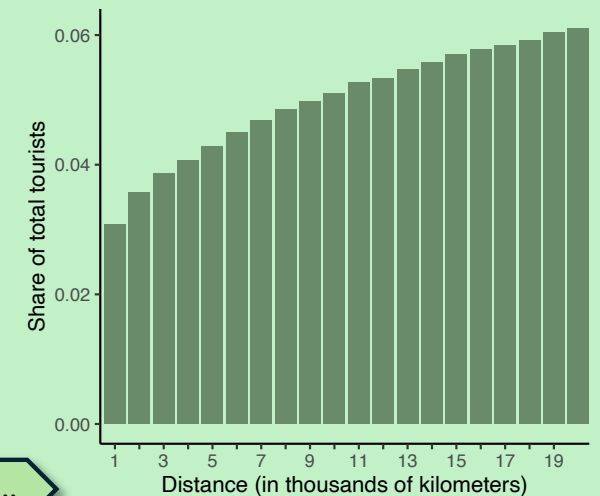

But ...

when controlling for **mediating** factors, such as island destinations 🏝️, sea access 🌊, and world heritage sites 🏛️, the distance-decay effect becomes flatter.

Where ...

the distance-decay effect remains **constant** over time, both for domestic 🏠 and for international tourism ✈️.

Resulting in ...

more **total** tourists over larger distances, with potentially severe environmental effects ☀️, especially when incomes 💰 increase.
