

This meta-analysis summarizes and explains the variation in the **detering effect** of distance on tourism flows by analyzing 882 estimates from 182 primary studies utilizing data covering the last 25 years. We find a **total** distance-decay elasticity of -0.82.

But ...

when controlling for **mediating** factors, such as island destinations 🏝️, sea access 🌊, and world heritage sites 🏛️, the distance-decay effect becomes flatter.

Where ...

the distance-decay effect remains **constant** over time, both for domestic 🏠 and for international tourism ✈️.

Resulting in ...

more **total** tourists over larger distances, with potentially severe environmental effects ☀️, especially when incomes 💰 increase.
